

## ***Fast Facts on Immediate Implanted Dentition*** ***From Daniel Buchbinder, DMD, MD***

### **Finally, a safe, painless and immediate solution for your edentulous patients**

As an experienced dentist you're all too familiar with the medical, emotional and psychological problems faced by your edentulous patients. Whether patients are missing one or all of their teeth, sequelae—ranging from bone loss to nutritional deficits to premature aging—are often life-altering.

A customized patented surgical guide lets Dr. Buchbinder quickly and exactly drill and place implants for easy, fast, predictable surgery—and Immediate Implanted Dentition.

### **When traditional implantology is not acceptable**

While traditional implants work well for many, a significant number of patients resist implantology. They cite fears of multiple surgeries, general anesthesia and imperfect outcomes. And many busy patients—top executives, athletes, celebrities—can't squeeze the extended surgical timetable—usually 3-9 months—into overbooked schedules.

#### **Perfect Teeth in One Hour** **Only Four Visits Needed**

**Visit One:** Clinical evaluation and diagnosis.

*In between visit one and twos, Dr. Buchbinder prepares a comprehensive treatment plan.*

**Visit Two,** 3-5 days later: Impressions made of your patient's jaws and bite; dentures evaluated and optimized.

**Visit Three,** 3-7 days later. Your patient scanned with state-of-the-art 3D Cone Beam technology.

*In between visits, Dr. Buchbinder converts digital files to 3D images of your patient's jaws and teeth. He performs virtual surgery and emails files to a state-of-the-art lab in Goteborg, Sweden.*

*Within a week, the lab crafts a precise surgical guide, a maxillary model and express mails customized surgical tools to Dr. Buchbinder. His partner, Dr. Okay, creates a final set of natural, perfectly fitted teeth.*

**Final visit,** 3-5 days later: During a 60-minute visit, Dr. Buchbinder uses the customized surgical guide and tools to place implants and teeth. Local anesthesia is used in the vast majority of cases. **No incisions, stitches, swelling or pain.**

#### **Instant gratification for your patients**

Dr. Daniel Buchbinder, Chief of Oral and Maxillofacial Surgery at Beth Israel Medical Center, New York City, now offers a revolutionary, permanent and almost instantaneous solution for your edentulous patients. A proprietary procedure recently approved by the FDA, Immediate Implanted Dentition (IID), gives your patients the beautiful, fully functioning teeth they dream of. And it requires only **one 60-minute surgical procedure.** (See sidebar for details.)

#### **Surgical and prosthodontic expertise for your peace of mind**

Dr. Buchbinder is an acclaimed maxillofacial surgeon who collaborates with prosthodontist, Devin Okay, DDS. The partners are two of only 400 dental professionals nationwide trained to provide IID. Refer with confidence knowing your patients receive superb supportive care backed by the world-class resources of Beth Israel.

#### **Hope for your most complicated cases**

Dr. Buchbinder better the lives of patients whom other dentists can't or won't consider for IID. Able to expertly correct most malocclusions, Dr. Buchbinder can also help rebuild missing bone using distraction osteogenesis, oosteotomy and other maxillofacial advances.

#### **Call us to learn about the life-changing possibilities for your patient**

Please call us at 212-844-8775 to find out how IID can help your patient live a healthier and happier life. Call today—we look forward to hearing from you.

**(over, please)**

## Fast Facts on Immediate Implanted Dentition

**Fact:** More than 31 million Americans have one or more missing teeth and 13 million Americans age 65 or older are missing *all* their teeth.

**Fact:** Immediate Implanted Dentition has a success rate of 98%—the same as traditional implantology.

**Fact:** Most patients can eat within two hours of IID surgery and many return to work on the same day of their surgery.

**Fact:** Immediate Implanted Dentition can be less expensive than traditional implants. For many patients the hours spared from multiple surgeries, sick days and long recovery/healing periods adds up to tangible—and significant—savings.
